

Many truckers have XM Radio in their trucks and find it very helpful when traveling in unfamiliar cities to have at the touch of a button the traffic and weather without having to wait several minutes, if they can find it at all. If local programmers are concerned, the FCC should set aside a single low power FM frequency to be used in all cities with local weather and traffic. If the local service is better than the satellite service then people will listen. It is often a matter of safety to be able to find traffic and weather instantly. Let's not push back technology for selfish reasons. Thank You
Robert York
